

The Network

Ten feeder routes into Frankfurt and Munich.

The A319 Problem

A319 is never the right choice, at any demand level.

The Crossover Point

A320neo and A321neo consistently cross around 190-210 passengers, driven by A320neo's fixed 180-seat cap, not by the route.

The Prague Problem

Prague is unprofitable in every scenario tested. No aircraft and no demand level changes that.

The Full Picture

A network snapshot at 160 passengers. Routes where BELF > Actual LF represent structural deficits on passenger ticket sales.

The Boundaries of the Model

MUC-POZ was cancelled in 2026, while MUC-BUD remains active, despite both routes sharing the same profit curves. Our model can't tell these apart, which shows the limit of our analysis.
